## 1.0 Executive Summary

Data Transfer Solutions, LLC (DTS) performed a pavement condition assessment for the City of Brownsville, Texas to compliment and update the existing Pavement Management Plan (PMP). The data collection started in March of 2020 and was completed in May of 2020. This report provides the processes and procedures for pavement condition data collection and evaluation, assessment of the results, and maintenance recommendations for the City's maintained roadway network.

The pavement condition assessment includes an automated mobile data collection, calculated Pavement Condition Index (PCI) and delivery of an ESRI file geodatabase. The assessment and conditions rating were performed in general accordance with national standards, where applicable.

VUEWorks® Asset Management Software (AMS) was used to calculate the PCI. The PCI is a numerical rating of the pavement condition based on the type and severity of distresses observed on the pavement surface. The PCI value is represented by a numerical index between 0 and 100, where 0 is the worst possible condition and 100 is the best possible condition. The network PCI was determined following the American Society for Testing and Materials (ASTM) D6433-11 "Standard Practice for Roads and Parking Lots Pavement Condition Index Surveys". The average of the road segment PCI values for the collected roads was calculated to be **72** at the time of collection. This value indicates the roadway network is generally in 'Satisfactory' condition.

Table 1 lists the City's roadway network system surveyed as part of this pavement condition project.

**Table 1: Pavement Inspection Breakdown**

Item	Description	Centerline Miles	Percent of Centerline Miles
<b>1</b>	Asphalt Segments with PCI	641.92	92.75%
<b>2</b>	Concrete Segments with PCI	17.09	2.47%
<b>3</b>	Brick Segments without PCI	0.04	0.01%
<b>4</b>	Not Collected – Construction	0.73	0.11%
<b>5</b>	Not Collected – Does Not Exist	17.77	2.57%
<b>6</b>	Not Collected – Inaccessible	10.65	4.54
<b>7</b>	Not Collected – Unsurfaced	3.88	0.56%
	Total With PCI	659.01	95.22%
	Total Without PCI	33.08	4.78%
	<b>Total</b>	<b>692.09</b>	<b>100%</b>

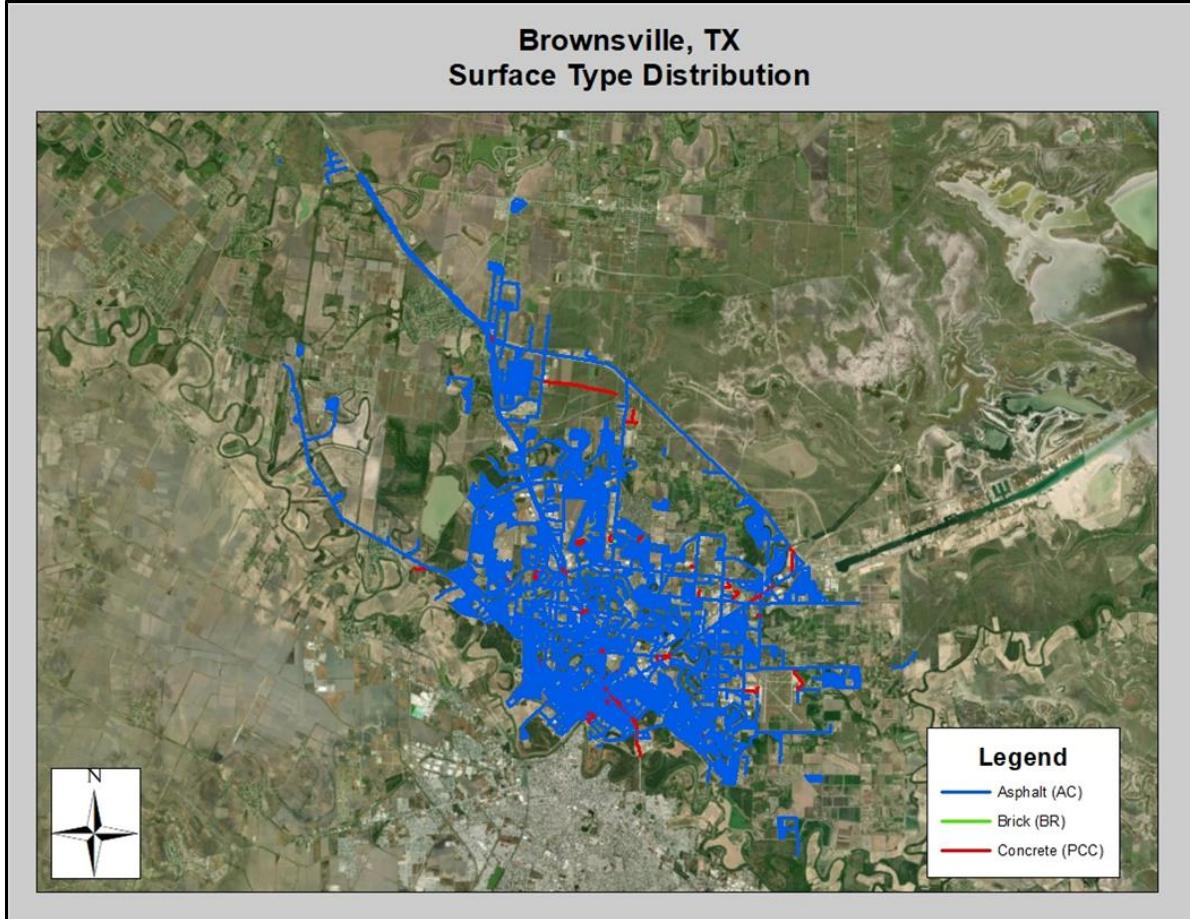

## 2.0 Introduction

A pavement condition survey was conducted from March of 2020 to May of 2020 on 692.09 centerline miles. A Mobile Asset Collection (MAC) vehicle was used to collect street-level right-of-way (ROW) and pavement images. Pavement images were used to determine street segment pavement conditions while the street level ROW images were used to identify area distresses. The results of this analysis of the roadways were used to develop multiple budget scenarios in VUEWorks® AMS and evaluate the maintenance needs of the City's roadway network.

Roadway networks are usually divided into four pavement surface types: Asphalt Concrete (AC), Portland Cement Concrete (PCC), Brick (BR), and Unsurfaced (UNS). The distribution of the roadway network by surface types in the City is displayed in Figure 1. These types of roads account for the entirety of the collected roadway network, with approximately 659.01 centerline miles (95.22%) of surveyed roadway. Approximately 333.08 centerline miles (4.78%) of roadway were unable to be collected (Table 1 lists the inspection breakdown).

The pavement condition survey included a set of pre-defined parameters to develop both a segment and network level index (number) that correlates to existing pavement surface conditions. This project used the ASTM D6433-11 'Standard Practice for Roads and Parking Lots Pavement Condition Index Surveys' pavement condition analysis method to determine the road segment and network PCI. The ASTM D6433-11 method covers the process of quantifying pavement conditions and identifies pavement distress types, distress extent measurements, and distress severity. ASTM D6433-11 outlines the method of PCI value calculation.

This project used VUEWorks® AMS for calculating the PCI value and analyzing the network PCI ranges. Additionally, VUEWorks® AMS was used in a parallel analysis for setting maintenance procedures and associated costs, developing budgets, and planning projects to meet the City's pavement maintenance requirements.

**Figure 1: Surface Type Distribution**

## 2.1 Sample Units

The ASTM D6433-11 procedure outlines how the road network is divided into sections and sample units; first identifying the branches of the pavement with different uses, then dividing each branch into sections based on pavement design, construction history, traffic, and condition. These sections are then divided into sample units that are approximately 2,600 square feet in size. The number of sample units to be inspected within each section may vary based on the following options: all the sample units in the section, a number of sample units that provides a 95% confidence level, or a lesser number. DTS typically follows the 95% confidence level method for a cost-efficient representation. Once the number of sample units to be inspected has been determined, the spacing interval of the units is computed using systematic random sampling. Samples are spaced equally throughout the section with the first sample selected at random, at least 100 feet from the intersection. The samples surveyed within the City of Brownsville consisted of approximately 201.68 centerline miles, comprising 29.14% of the total network.

DTS believes this sampling method provides the most economical representation of the 692.09 centerline miles of pavement conditions within the City of Brownsville. This approach has been used as a national standard for over 40 years to provide adequate representation of the roadway without the need to expend excessive time and money to evaluate 100% of the roadway.

Based upon the national standards, the first survey sample is typically not located within 100 feet of an intersection for multiple reasons. Intersections often contain specific distresses that are not observed throughout the remainder of the pavement section and would not represent the condition of the overall section. Intersections also receive traffic from both directions along with severe turning and stopping movements that are not indicative of the traffic in most of the pavement section. As a result, specific and localized maintenance may be required for the intersections. It is important to note that the PCI method is designed as a network-level analysis for the overall condition of pavement sections and is not intended to provide the information required to make detailed maintenance decisions. DTS recorded and provided images for all intersections; therefore, distress and condition ratings can be extracted from the images in the intersections upon specific request.

### 3.0 Purpose

The purpose of this report is to describe the tools, processes and procedures used to collect and analyze the pavement condition data as well as provide a summary of the results obtained from calculating each segment's PCI using VUEWorks® AMS.

A pavement begins to deteriorate from the day it is constructed. Many factors affect the deterioration rate, such as the traffic loads, climatic conditions, age, material durability, damage caused by poor drainage and construction factors. These factors cause the deterioration rate to be different for every pavement section. In order to manage a large pavement network, "family performance curves" were developed from available data to represent the expected performance of like roadways and to help determine optimal times to apply preventive and rehabilitation treatments. In order to develop more accurate curves, periodic evaluations of the pavement condition must be performed to gain a realistic representation of condition versus age of the pavement network. The graph in Figure 2 provides an example deterioration curve that represents the exponential deterioration of a typical pavement.

As shown in the graph, the initial deterioration of the pavement is at a slow rate and, after approximately 40% to 50% of a pavement's service life, the pavement rapidly deteriorates. Understanding the condition and age at which this rapid drop in condition occurs is very valuable in determining the optimal time for maintenance. This philosophy is the basis for good pavement management. The purpose for this condition evaluation is to better understand the value in preventive maintenance versus reactive maintenance, which is often at a much higher cost.

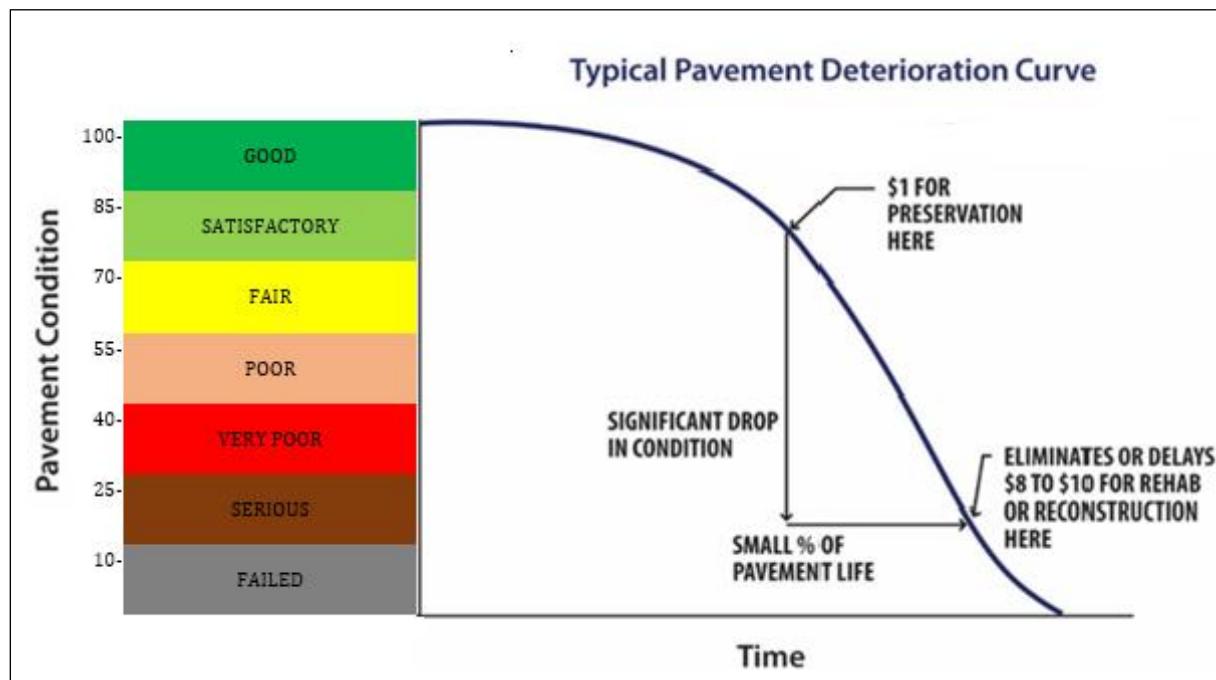

Figure 2: Deterioration Curve Example

The industry standard is to assess pavements every three to five years. More frequent assessments will likely not indicate significant changes in the condition since most pavements are anticipated to deteriorate two to five points per year. Assessments that take place more than five years apart will likely miss critical changes and not provide adequate data to define points in the curve where

preventive maintenance is best applied. DTS recommends assessments every three years for networks greater than 500 miles.

Each road segment's construction date, and in turn its percent (%) life used, was back-calculated based upon its current PCI rating and the VUEWorks® asphalt deterioration curve. Every road segment's PCI value is anticipated to deteriorate according to this curve until pavement maintenance work is performed. The VUEWorks® deterioration curves are based on the assumption of a 40-year life for asphalt roads and 50-year life for concrete.

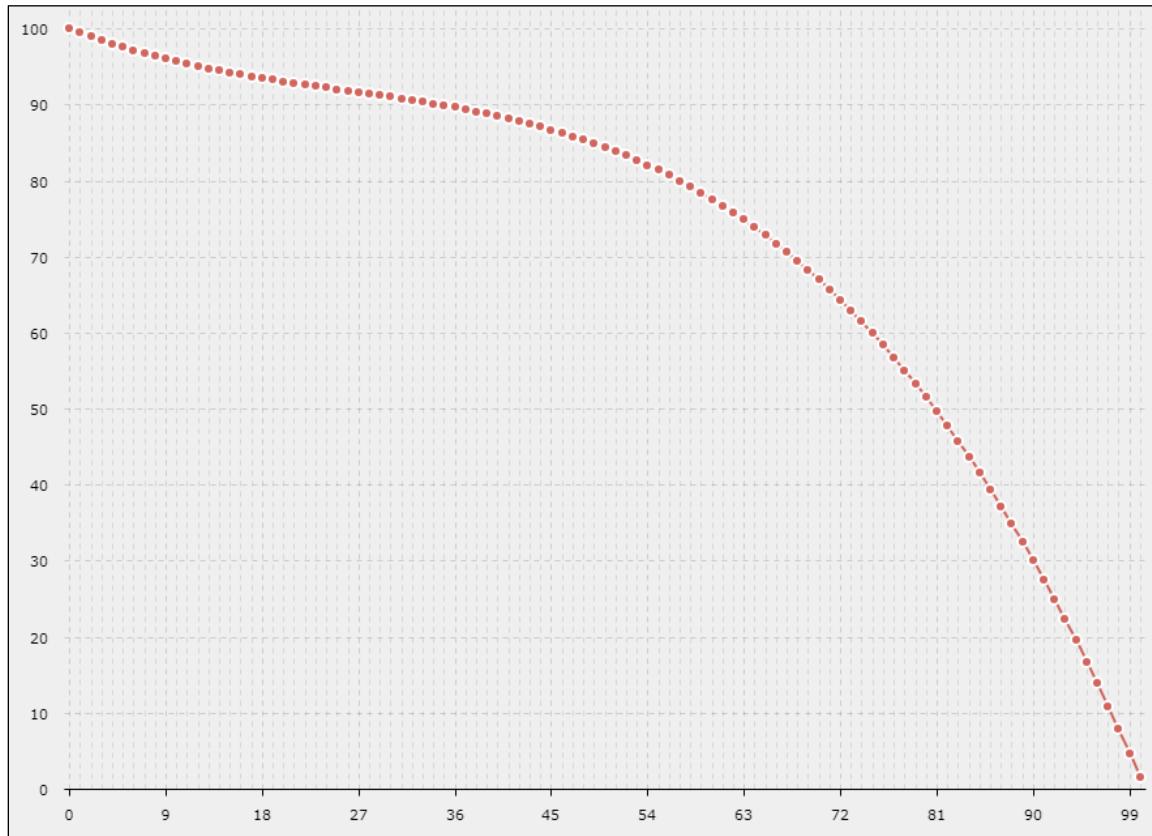

Figure 3: Deterioration Curve

## 4.0 Project Scope and Methodology

The overall project scope of work included the six tasks outlined below:

- Verify the City's road network
- Mobile image data collection
- Pavement Condition Index (PCI)
- Import pavement condition data to VUEWorks®
- Pavement condition final report
- Pavement maintenance optimization

## 5.0 Automated Data Collection and Equipment

In order to determine the general distress characteristics of each roadway segment, DTS utilized a MAC vehicle, displayed in Figure 4, to collect street-level ROW imagery and downward pavement imagery. The MAC vehicle utilized a Class 1 device as defined by the specifications.

DTS MAC vehicles combine multiple engineered technologies to collect real-time pavement data, ROW data and images at posted speed limits. This effectively eliminates the need to place pavement inspection technicians in the field in close proximity to vehicle traffic. Some MAC vehicle components include:

### Navigation System

- **International Measure Unit (IMU):** Generates a true representation of vehicle motion in all three axes; produces continuous, accurate position and orientation information
- **Position and Orientation Computer System:** Enables raw GPS data from as few as one satellite to be processed directly into the system, to compute accurate positional information in areas of intermittent, or no GPS reception
- **GPS Receivers:** Provide heading aiding to supplement the inertial data
- **GPS Antennas:** Generate raw observables data
- **Sub-meter accuracy:** Rated to get 0.3 m accuracy in the X, Y position and 0.5 m in the Z position

### Distance Measuring Indicator (DMI)

- Allows for collection of high-resolution imagery at posted speeds. DMI computes wheel rotation information to aid vehicle positioning.

### Cameras

- High-definition cameras with precision lenses allow for accurate asset extraction and videolog recording
- Frame rate: 15 images per second, with 1936 x 1456 color resolution

### Pavement Imaging System

- Two line-scan cameras and lasers configured to image 4m transverse road sections with 1 mm resolution (4000 pixel) at speeds that can reach 100 km/h
- Allows fully illuminated pavement image collection even in heavy shadow/canopy areas

**Figure 4: DTS MAC Vehicle**

Downward-facing pavement images were used in quantifying distress type, severity and extents present on segments of road. The resolution of the imagery allows for distresses to be easily identified and measured during the analysis portion of the contract.

Mobile image collection of the City's roadway network was accomplished through coordination with the City's staff. Efforts associated with the mobile image collection included review of client GIS street centerline file, route planning based on GIS street centerline, and coordination of existing construction projects along the City's streets. All MAC image collection routes were reviewed by both DTS and the City's staff to assure all streets attained complete image coverage. This effort was accomplished by reviewing a GIS shapefile of the MAC daily GPS point associated to each image collected overlaid on the GIS street centerline file, as displayed in Figure 5. The DTS MAC vehicle collected pavement and ROW images every 25 feet along each street segment.

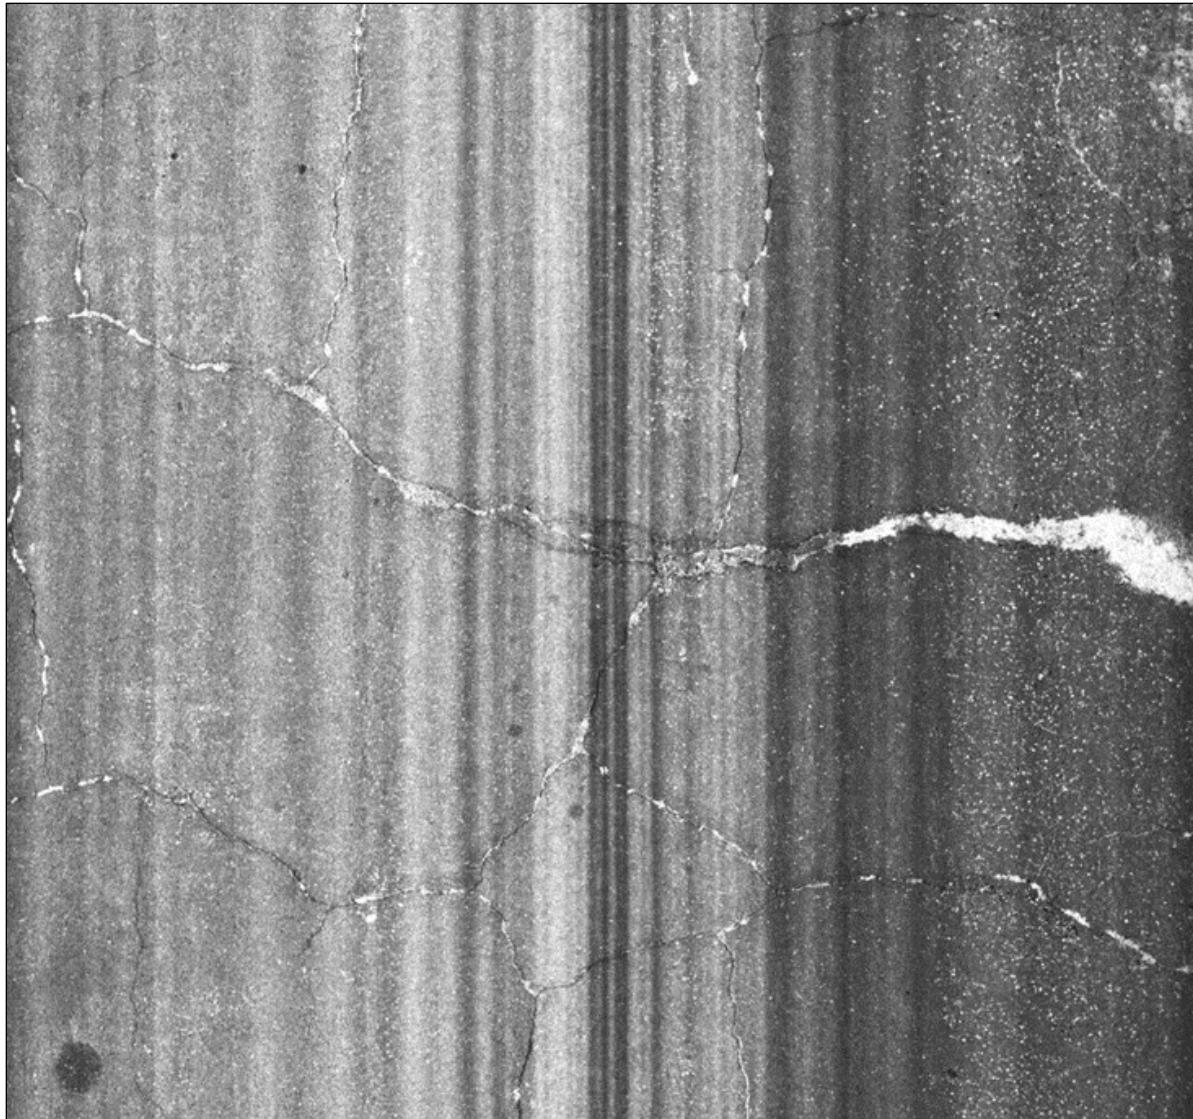

**Figure 5: Network Coverage Map**

DTS MAC image collection included a daily check of the on-board systems. This vehicle component check consisted of a calibration site survey of a nine-point grid in state plane coordinates, as displayed in Figure 6. Each morning and afternoon, before and after a day's image collection, the MAC vehicle drove over the surveyed location. The MAC technician then extracted each point's location to verify the location of the point extracted was within approximately three feet of the surveyed points. DTS' QA/QC manual includes additional details regarding MAC quality control procedures.

**Figure 6: Nine- Point Calibration Site Example**

Each day's image and road data collection were recorded on a MAC server and backed up to an external hard drive. The external hard drives were mailed back to DTS' project office where the data was placed on a production server for post-processing of images and data, quality control review, and pavement distress inventory.

**Figure 7: Pavement Image Example**

ROW images were also collected as part of this contract. Figure 8 displays an example of a ROW image. The MAC vehicle was configured with a four-camera setup; three forward-facing cameras and one rear-facing camera. The images were captured at roughly 25-foot intervals and were postprocessed using collected inertial and GPS data. This allowed for more accurate asset extraction to be completed.

**Figure 8: Right-of-Way Image Example**

The automated data collection effort for the City of Brownsville roadway network began in November of 2018 and was completed in July of 2019.

## 6.0 Pavement Condition Assessment

The MAC GPS, IMU, DMI, and ROW imagery is post-processed daily. A project data dictionary that includes all distress types and allowable severities was created after coordination with the City. This data dictionary is provided to trained pavement condition technicians who utilize DTS' spatial image analysis software EarthShaper™ to analyze and digitize pavement distress types, extents and severities as a point, line and/or polygon, displayed in Figure 9. Depending on the distress type measurement required by the project data dictionary, each distress was digitized, recorded in the pavement condition database and associated to the road section that was surveyed. In addition, each road section's total type, severity and extent of distresses was calculated.

**Figure 9: EarthShaper™ Pavement Tool Example**

This method of pavement distress inventory provides a quantifiable and repeatable process for the City to use in future MAC image collection projects. Each road segment, in conjunction with the pavement and ROW imagery, allows pavement engineers to review each pavement technician's data, allowing for an open quality control process.

After completion of distress identification and analysis, the City's roadway network distress data was then imported into VUEWorks® AMS where the PCI was calculated.

## 6.1 Pavement Distress Inventory

A pavement distress inventory consists of identifying specific pavement surface distress types that are associated with the degradation of a pavement surface due to traffic loads, environmental factors, lack of maintenance and other anthropogenic or natural occurrences. The distress type is then assigned a severity rating (low/moderate/high), and the extents of the distress type and severity are recorded. For this project, the pavement distress types, severity definitions and measurements were inventoried utilizing the ASTM D6433-11 method of pavement condition assessment for both AC and PCC pavements. The inspections covered 100% of the length of a sample for the outside lane of travel and, for roads with three or more lanes, the inspection covered the outside and the inside lane. Those roads were inspected utilizing the ASTM D6433-11 sampling approach (completed for both directions of travel).

### Definitions (units of measure)

- AC Bleeding & Pumping ( $\text{ft}^2$ ) represents excessive use of bituminous binder in the asphalt mix.
- AC Fatigue (Alligator) Cracking ( $\text{ft}^2$ ) is associated with fatigue due to traffic loading and visually looks as interconnected cracks forming small pieces ranging in size from about 1" to 6" typically in the wheel path.
- AC Block Cracking ( $\text{ft}^2$ ) usually intersect at nearly right angles and range from one foot to 10' or more across. The closer spacing indicates more advanced aging caused by shrinking and hardening of the asphalt over time.
- AC Edge Cracking ( $\text{ft}$ ) is parallel to and usually within 1.5 feet of the outer edge of the pavement. This distress is accelerated by traffic loading and can be caused by frost-weakened base or subgrade near the edge of the pavement.
- AC/PCC Lane/Shoulder Drop-off ( $\text{ft}$ ) is a difference in elevation between the pavement edge and the shoulder. This distress is caused by shoulder erosion, shoulder settlement, or by building up the roadway without adjusting the shoulder level.
- AC Linear Cracking (trans/long) ( $\text{ft}$ ) typically occurs in overlays where the crack is reflected through the overlaying asphalt surface.
- AC Patching ( $\text{ft}^2$ ) is an area of pavement that has been replaced with new material to repair existing pavement.
- AC Potholes (count) are small, usually less than 30 inches in diameter, bowl-shaped depressions in the pavement surface. Generally, have sharp edges and vertical sides near the top of the hole.
- AC Raveling & Weathering ( $\text{ft}^2$ ) is loss of pavement material from the asphalt surface. Typically raveling is caused by stripping of the bituminous film from the aggregate or hardening of asphalt due to aging. Poor compaction, especially in cold weather construction, or insufficient asphalt content are also causes of raveling.
- AC Slippage Cracking ( $\text{ft}^2$ ) are crescent of half-moon shaped cracks, usually transverse to the direction of travel. They are produced when braking or turning wheels cause the pavement to slide or deform.
- AC Rutting ( $\text{ft}^2$ ) is a surface depression in the wheel paths.
- PCC Corner Break (slab count) is a crack that intersects the joints. Load repetition combined with loss of support and curling stresses usually cause corner breaks.
- PCC Divided Slab (slab count) is when a slab is divided into four or more pieces due to overloading, or inadequate support.

- PCC Durability "D" Cracking (slab count) is caused by freeze-thaw expansion of the large aggregate, which gradually breaks down the concrete. Usually appears as a pattern of cracks running parallel and close to a joint or linear crack.
- PCC Joint Sealant Damage (slab count) is any condition that enables soil or rocks to accumulate in the joints or allows significant water infiltration.
- PCC Linear Cracking (trans/long) (slab count) divide the slab in two or three pieces and are usually caused by a combination of repeated traffic loading, thermal gradient curling and repeated moisture loading.
- PCC Patching, Large/Utility Cut (slab count) is an area where the original pavement has been removed and replaced by new pavement.
- PCC Patching, Small (slab count) is an area where the original pavement has been removed and replaced by filler material.
- PCC Polished Aggregate (slab count) is caused by repeated traffic applications. There are no rough or angular aggregate particles to provide good skid resistance.
- PCC Popouts (slab count) is a small piece of pavement that breaks loose from the surface due to freeze-thaw action, combined with expansive aggregates. Usually range in diameter from 1 to 4 inches and in depth from  $\frac{1}{2}$  to 2 inches.
- PCC Punchout (slab count) is a localized area of the slab that is broken into pieces. This distress is caused by heavy repeated loads, inadequate slab thickness, loss of foundation support or localized concrete construction deficiency.
- PCC Scaling/Map Cracking/Crazing (slab count) is a network of shallow, fine or hairline cracks that extend only through the upper surface of the concrete. Usually caused by concrete over-finishing and may lead to scaling, which is the breakdown of the slab surface to a depth of  $\frac{1}{4}$  to  $\frac{1}{2}$  in.
- PCC Shrinkage Cracks (slab count) are hairline cracks usually less than 6 feet long and do not extend across entire slab. They are formed during the setting and curing of the concrete and do not extend through the depth of the slab.
- PCC Spalling, Corner (slab count) is the breakdown of the slab within 1.5 feet of the corner. Usually caused by traffic loading or infiltration of incompressible materials, weak concrete and/or water accumulation and freeze-thaw action.
- PCC Spalling, Joint (slab count) is the breakdown of the slab edges within 1.5 feet of the joint. Usually caused by traffic loading or infiltration of incompressible materials, weak concrete and/or water accumulation and freeze-thaw action.

## 6.2 Pavement Condition Index (PCI) Calculation

Each Road segment's PCI was calculated utilizing VUEWorks® AMS. This AMS is based on the ASTM D6433-11 method of calculating a road segment's PCI value using the pavement inventory database and ASTM D6433-11 deduct curve.

With a completed pavement condition inventory database, DTS imported the road segment, inspection, sample and distress information into the AMS, where the PCI was calculated. ASTM D6433-11 is based on a 0 to 100 rating scale where 0 represents a failed roadway condition and 100 represent an excellent roadway condition. Table 2 lists the City's custom PCI range categories, condition description and percent of the network in each range category and Figure 10 displays the PCI distribution throughout the City. Figure 11 below displays a zoomed-in example of PCI scores in the City of Brownsville.

**Table 2: PCI Ranges by Percent**

Pavement Condition Index (PCI) Range	Condition Description	Centerline Miles	Percent of Network
86-100	Good	262.11	37.87%
71-85	Satisfactory	150.24	21.71%
56-70	Fair	91.38	13.20%
41-55	Poor	72.12	10.42%
26-40	Very Poor	63.79	9.22%
11-25	Serious	18.82	2.72%
0-10	Failed	0.54	0.08%
NULL	Unclassified	33.08	4.78%
<b>Total</b>		<b>692.09</b>	<b>100%</b>

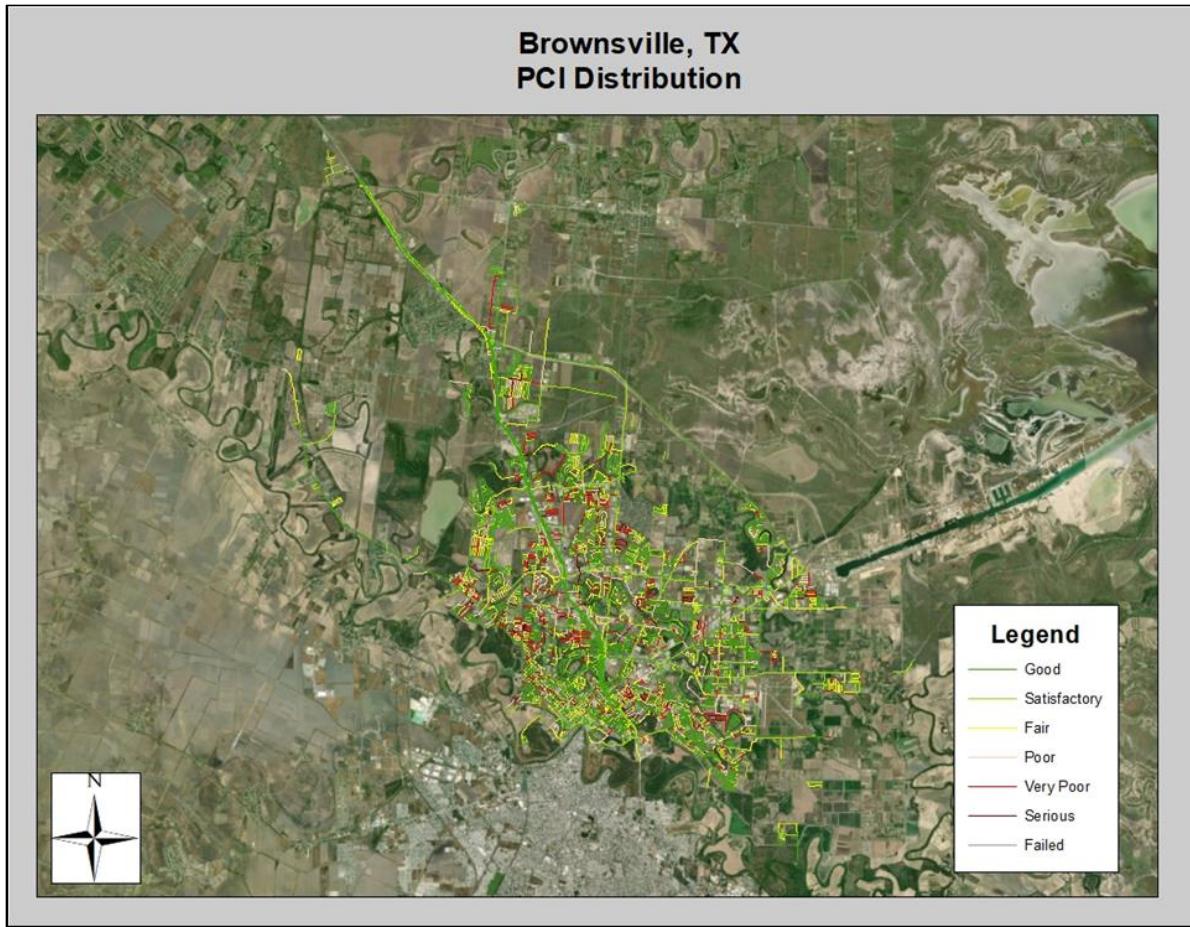

Figure 10: PCI Distribution Map

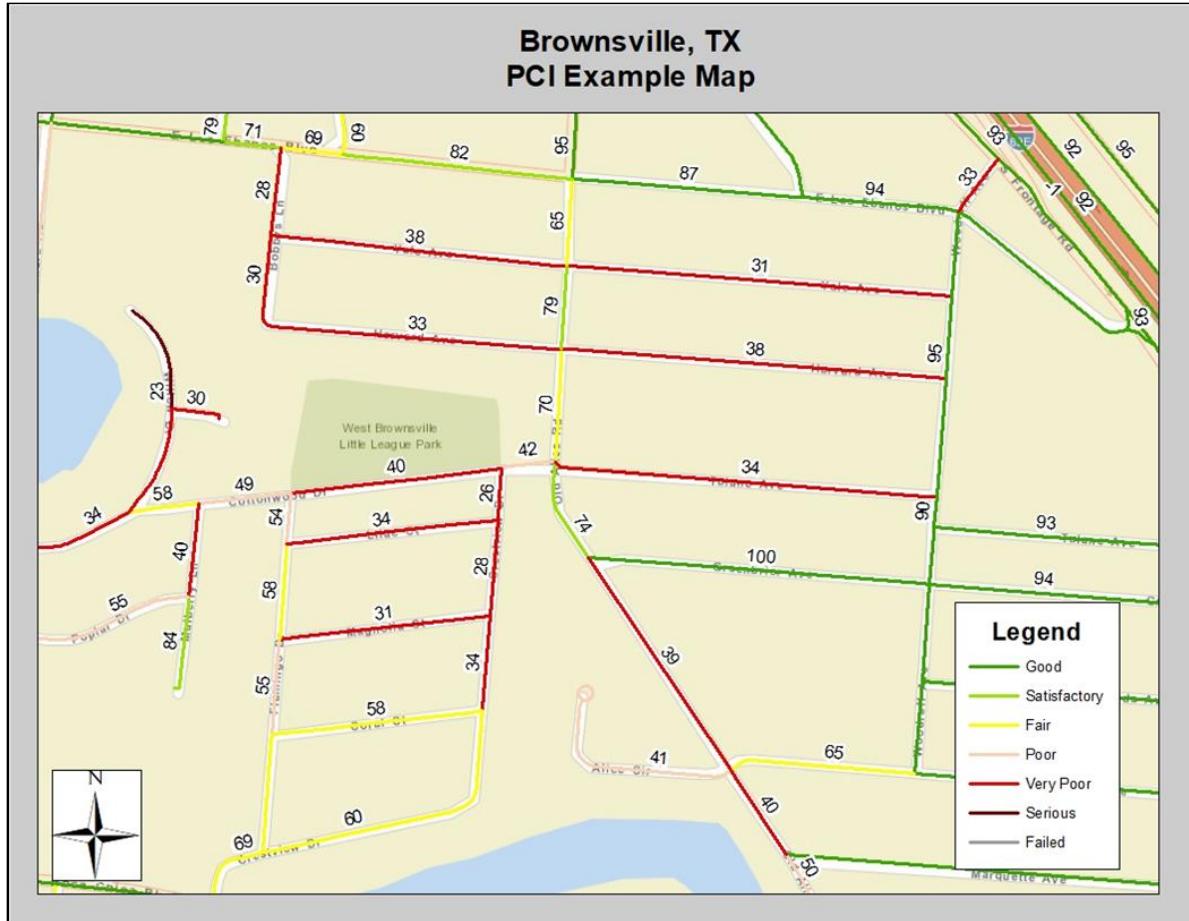

Figure 11: PCI Example Map

Table 3 lists the PCI range categories, condition description and percent of the network in each PCI range category based on the City's surface type.

Table 3: PCI Ranges by Surface Type with Percentile

	City of Brownsville, TX Roadway Network by Surface Type						
	<b>Good (86-100)</b>	<b>Satisfactory (71-85)</b>	<b>Fair (56-70)</b>	<b>Poor (41-55)</b>	<b>Very Poor (26-40)</b>	<b>Serious (11-25)</b>	<b>Failed (0-10)</b>
<b>Asphalt</b>	39.05%	21.63%	13.45%	10.80%	9.58%	2.82%	0.08%
<b>Concrete</b>	0.72%	1.16%	0.42%	0.14%	0.10%	0.04%	0%
<b>All</b>	39.77%	22.80%	13.87%	10.94%	9.68%	2.86%	0.08%

The PCI value for each road segment can be viewed in the City's VUEWorks database. The average of the road segment PCI values for the collected roads was calculated to be **72** at the time of collection. This value indicates the roadway network is generally in 'Satisfactory' condition.

### 6.3 Pavement Condition Assessment Results

The roadway network consists of 692.09 centerline miles of roadway. Table 1 lists the distribution of the current roadway network by surface type and outlines the number of miles that were able to be collected and analyzed, as well as the number of miles that were not able to be collected. Approximately 33.08 centerline miles of segments were not collected due to the segment not existing, being unsurfaced, construction, or the segment not being accessible.

Figure 11 and Table 4 display the breakdown of the types of distresses for asphalt and Figure 12 and Table 5 display the breakdown of the types of distresses for concrete.

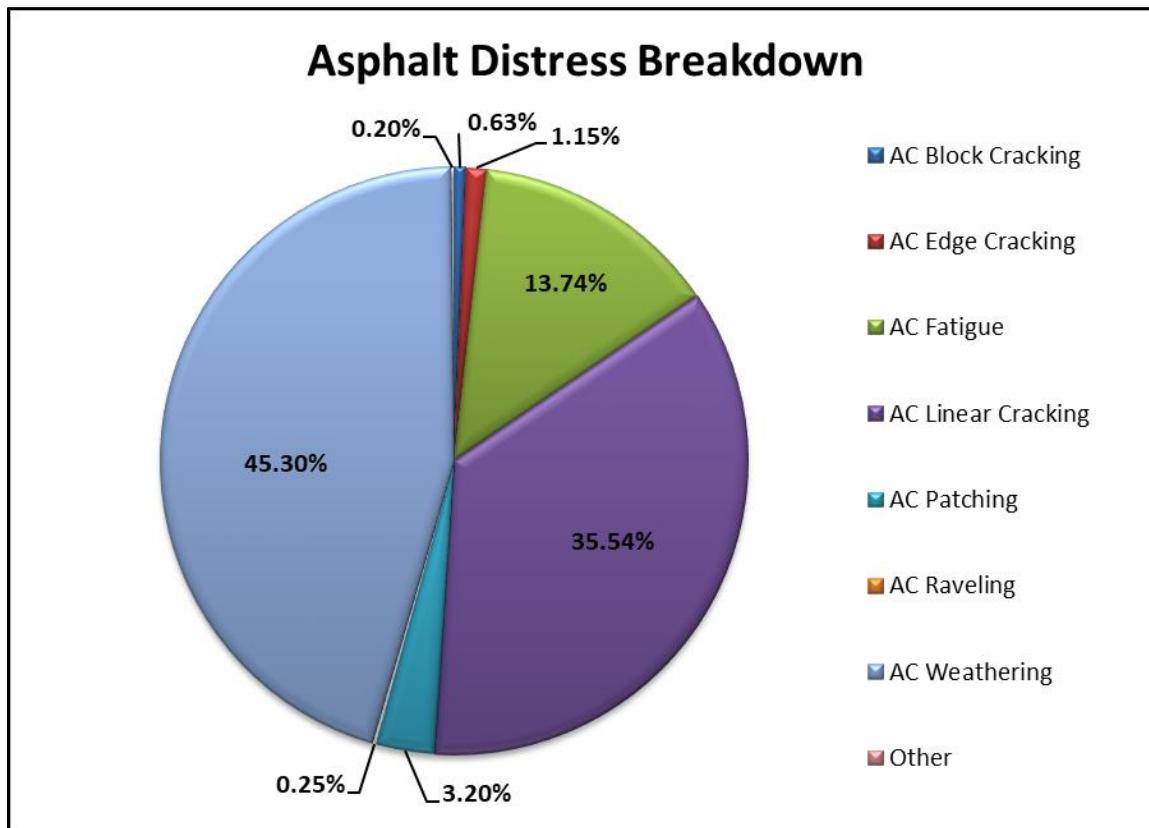

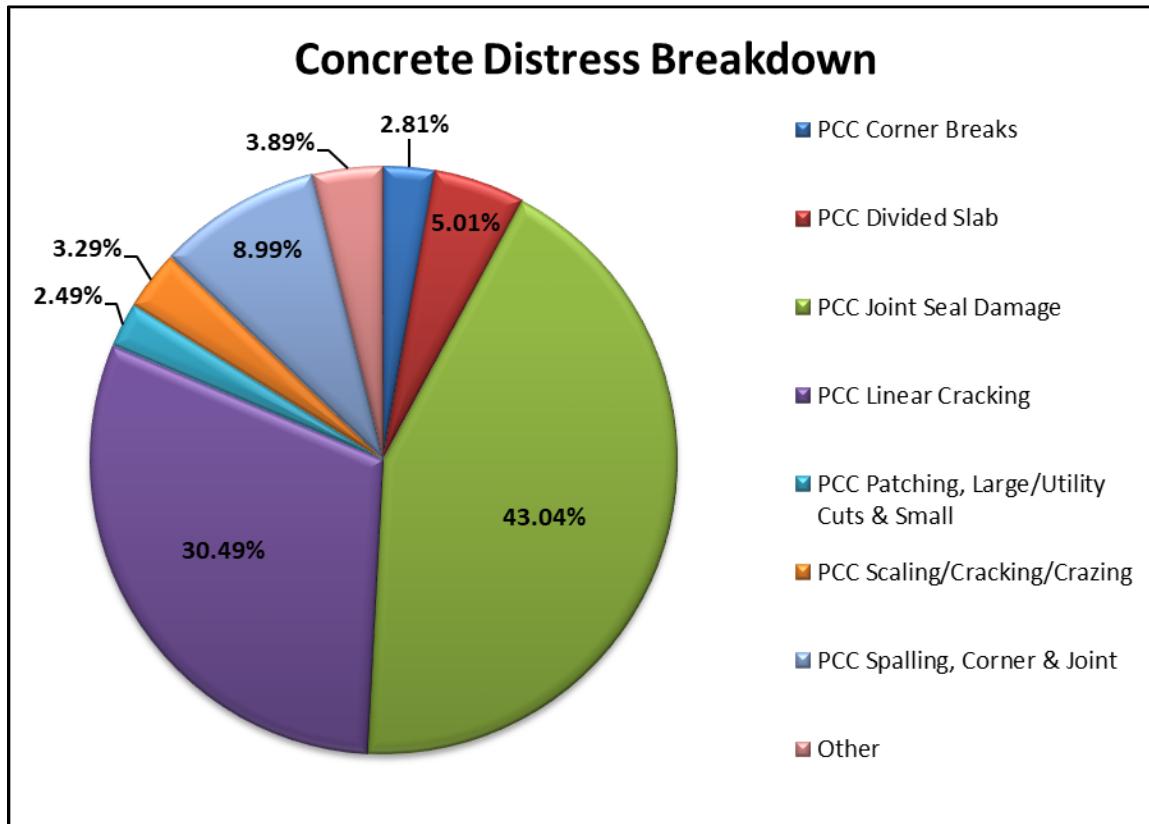

Figure 12: Asphalt Distress Breakdown

**Table 4: Asphalt Distress Breakdown by Severity**

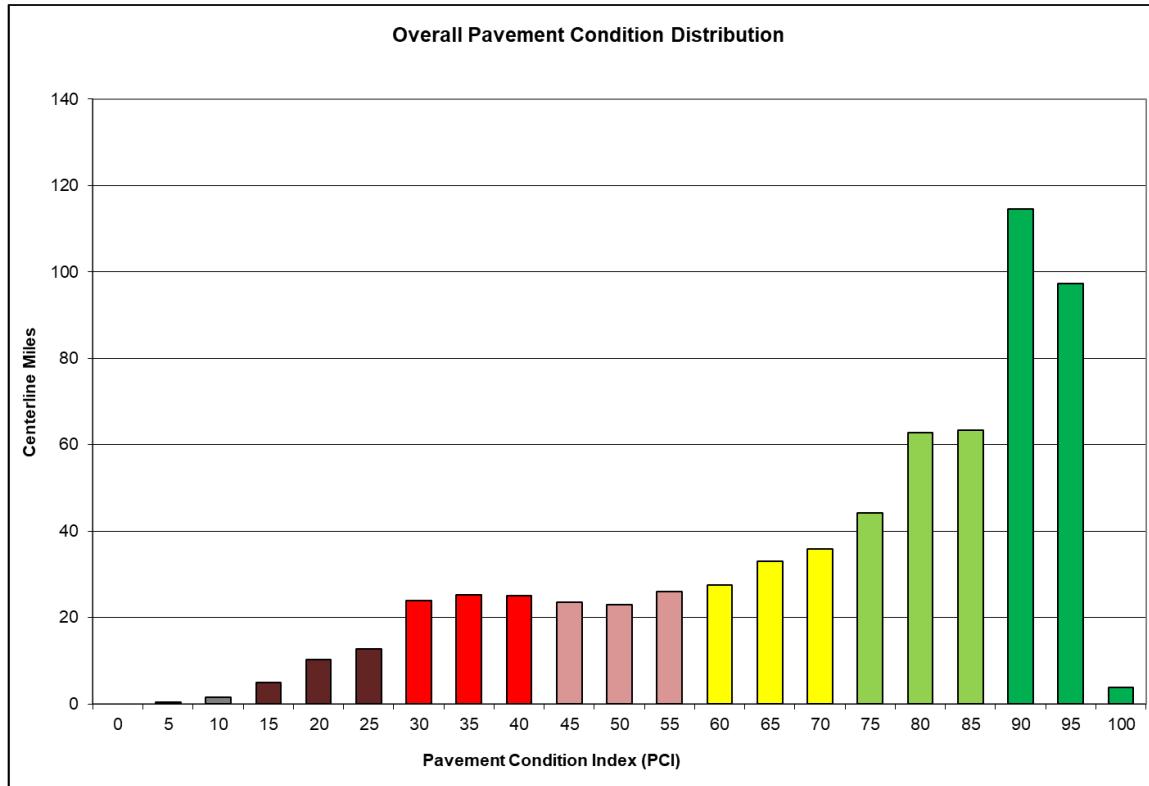

Type \ Severity	LOW	Moderate	HIGH
<b>AC Block Cracking</b>	2.72%	1.08%	0.01%
<b>AC Edge Cracking</b>	3.56%	1.63%	0.80%
<b>AC Fatigue</b>	4.04%	4.28%	0.40%
<b>AC Lane/Shoulder Dropoff</b>	0.39%	0%	0%
<b>AC Linear Cracking</b>	20.41%	11.59%	0.83%
<b>AC Patching</b>	10.83%	3.40%	0.12%
<b>AC Pothole</b>	0.57%	0.44%	0.04%
<b>AC Raveling</b>	0.03%	2.64%	2.58%
<b>AC Slippage Cracking</b>	0.01%	0%	0%
<b>AC Weathering</b>	18.43%	9.00%	0.18%

**Figure 13: Concrete Distress Breakdown**

**Table 5: Concrete Distress Breakdown by Severity**

Type \ Severity	LOW	Moderate	HIGH
<b>PCC Corner Breaks</b>	1.22%	0.43%	0.03%
<b>PCC Divided Slab</b>	1.44%	0.52%	0%
<b>PCC Joint Seal Damage</b>	12.63%	12.35%	11.04%
<b>PCC Linear Cracking</b>	20.76%	1.93%	1.01%
<b>PCC Patching, Large/Utility Cuts</b>	2.08%	0.37%	0.03%
<b>PCC Patching, Small</b>	0.73%	0%	0%
<b>PCC Scaling/Cracking/Crazing</b>	12.08%	2.78%	0.06%
<b>PCC Shrinkage Cracks</b>	3.55%	N/A	N/A
<b>PCC Spalling, Corner</b>	2.45%	1.13%	0.12%

Figure 14 represents the overall pavement condition distribution based on centerline miles.

**Figure 14: Overall Pavement Condition Distribution**

## 7.0 Pavement Maintenance Methods

The specific activity to perform on each road depends upon the pavement distresses observed. The following pavement maintenance and preservation methods are currently performed on the City's roadways.

### **Crack Sealing**

Sealing and filling asphalt AC pavement cracks is a common road maintenance activity. Specialized materials are placed into or above cracks to prevent the intrusion of water and incompressible material into the cracks and to reinforce the adjacent pavement. This type of distress treatment will address alligator cracking, longitudinal/transverse cracking and block cracking.

### **Single Chip Seal**

A single chip seal is an application of binder followed by an aggregate. This is used as a pavement preservation treatment and provides a new skid resistant wearing surface, arrests raveling, and seals minor cracks.

### **Slurry Seal**

Slurry seal is a mixture of aggregate (small rock), asphalt emulsion, cement and water. The asphalt emulsion serves as a binder, holding the crushed aggregate together and adhering the new slurry surface to the old surface which it is being applied over. Mixing and spreading are accomplished in one continuous operation, with the applied surface being ready for traffic within a few hours. This is similar to a chip seal but mostly used on low-volume traffic roads.

### **Panel Replacement**

Panel replacement is defined as a single slab to be replaced in kind. Slab replacement involves the full-depth, full lane width removal of a severely deteriorated concrete slab and replacing it with an appropriate repair material that meets the design life and opening-time demands of the project.

### **Milling and Overlay**

Milling of the road's surface is required to remove distresses that extend into the pavement. Asphalt overlay is a plant-mixed combination of asphalt cement and aggregate applied to the pavement in thicknesses usually between 1.5 inches and 2 inches for thick overlay and 0.625 inch and 1.125 inches for thin overlay. This type of rehabilitation will address alligator cracking, longitudinal/transverse cracking, raveling/weathering, friction loss, roughness, bleeding, block cracking and rutting.

### **Full Depth Reconstruction**

Full depth reconstruction consists of the complete removal of an existing asphaltic or concrete pavement, base re-work and new pavement structure construction. Typically, this method of pavement rehabilitation is used on excessively deteriorated roads with high severity distresses for a majority of the roadway extents. Additional analysis is typically required for a full depth rehabilitation including full depth pavement coring, traffic loading analysis and storm water drainage analysis.

## 7.1 Pavement Maintenance Funding

Various five-year pavement maintenance program scenarios were conducted for the City's asphalt and concrete roads. VUEWorks® AMS was used to determine the required budget levels needed to maintain and improve current conditions. The analyses included:

1. 5-Year Baseline Scenario: no budget was allocated to see how the network will deteriorate over 5 years with no work.
2. 5-Year Current Budget Scenario (Best First): using the City's current pavement budget of \$10M/year for five years to perform maintenance to those roads at the highest PCI level first.
3. 5-Year Current Budget Scenario (Worst First): using the City's current pavement budget of \$10M/year for five years to perform maintenance to those roads at the lowest PCI level first.
4. 5-Year Current Budget Alternative Breakdown Scenario (Best First): using an alternative breakdown of the City's current pavement budget of \$10M/year, 30% to preservation, 30% to rehabilitation and 40% to reconstruction for five years to perform maintenance to those roads at the highest PCI level first.
5. 5-Year \$15M Budget Scenario (Best First): using a pavement budget of \$15M/year for five years to perform maintenance to those roads at the highest PCI level first.

As part of this project, the City provided a list of current treatments types used within their preservation, rehabilitation and reconstruction work. The list included the cost for each treatment type per square yard. This inventory of the City's current activities, budgets, conditions and decision matrices was compiled and reviewed as part of this analysis. Tables 8 and 9 list the treatment activities and costs that were entered in the VUEWorks® AMS and used in the budget analyses for asphalt and concrete roads respectively.

**Table 6: Treatments, Activities, and Costs for Asphalt Pavement Roads**

Treatment Type	Activity	Treatment	Cost Per SY	Impact	PCI Range
Preservation	Local Repair	Crack Seal / Seal Coat	\$2.00	5 Points	85 - 95
Preservation	Surface Seal	Slurry Seal	\$6.00	15 Point	70 - 84
Preservation	Surface Seal	Chip Seal /Pothole Repair	\$15.00	100 Fixed	55 - 69
Rehabilitation	Major Rehabilitation	Mill and Overlay / Spot Repair	\$35.00	100 Fixed	40 - 54
Reconstruction	Reconstruction	Road Reclaim / Mill and Overlay	\$80.00	100 Fixed	25 - 39
Reconstruction	Reconstruction	Full Depth Reconstruction	\$95.00	100 Fixed	0 - 24

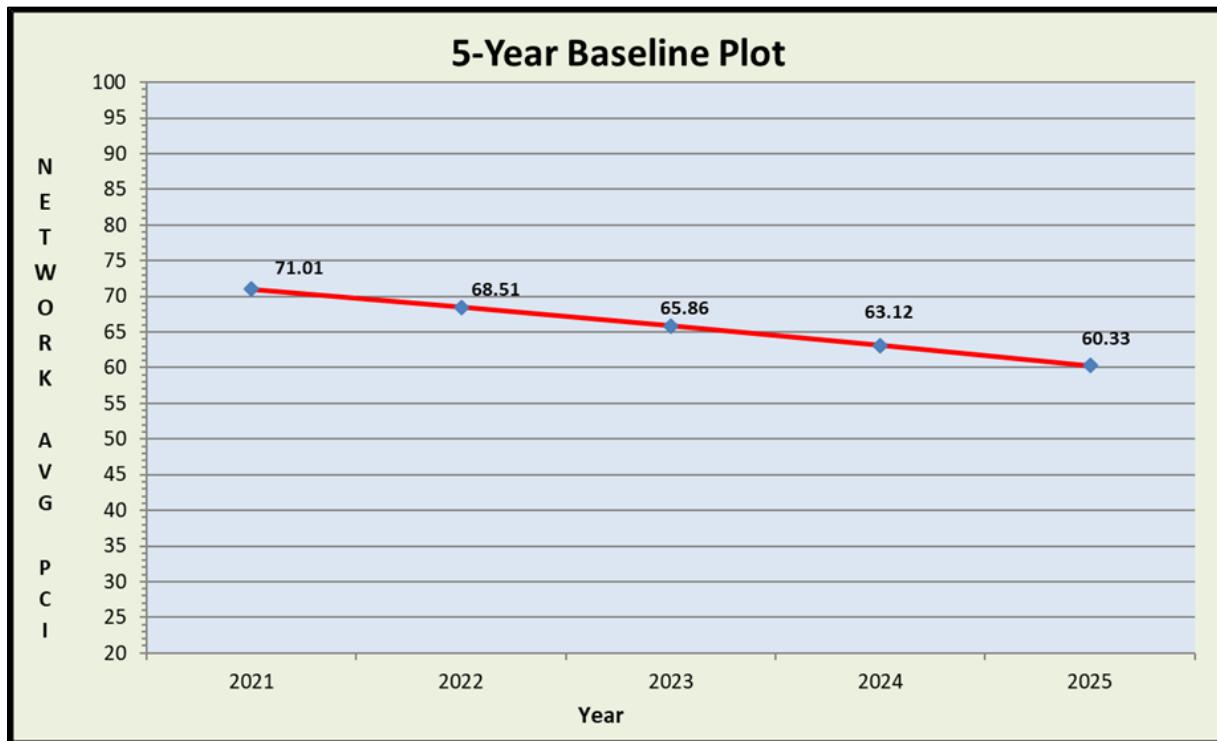

**Table 7: Treatments, Activities, and Cost for Concrete Roads**

Treatment Type	Activity	Treatment	Cost Per SY	Impact	PCI Range
Rehabilitation	Major Rehabilitation	Panel Replacement	\$65.00	100 Fixed	40 – 75
Reconstruction	Reconstruction	Full Depth Reconstruction	\$120.00	100 Fixed	0 – 39

VUEWorks® AMS was also used to model the existing condition data and develop the deterioration curve displayed in Figure 3. The road segment's PCI value is anticipated to deteriorate according to this curve until pavement maintenance work is performed. Based upon the average PCI value of 72 for the existing network, each scenario will start the plot with the adjusted PCI based upon the first year of treatments and deteriorate based upon future treatment and projected deterioration of the untreated road segments.

## 7.2 5-Year Baseline (Do Nothing) Scenario

If no work is performed over the next five years, this PCI rating is expected to decrease from a 71 to a 60 in 5 years. Figure 15 and Table 8 display the PCI and costs, respectively, in a “Do Nothing” scenario.

**Figure 15: 5-Year “Do-Nothing” Baseline Scenario– PCI Plot**

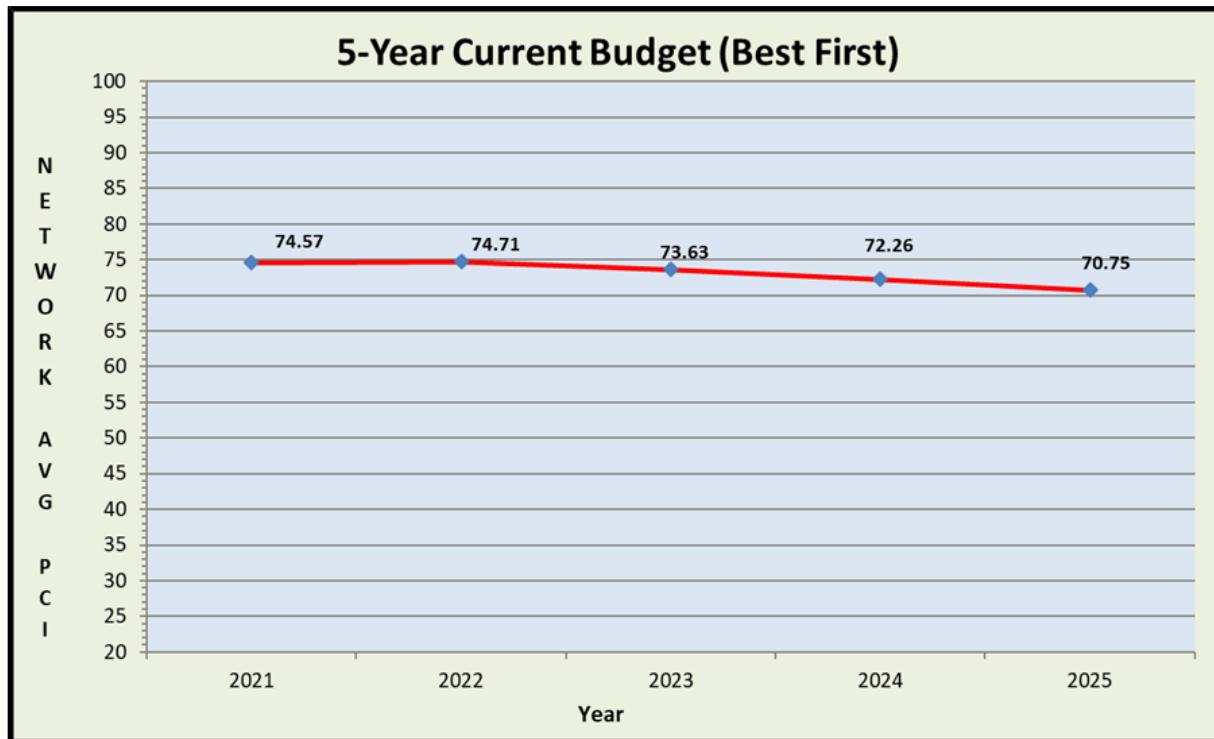

**Table 8: 5-Year “Do-Nothing” Baseline Scenario – Total Funded Plan Cost**

<b>Year</b>	<b>Avg. PCI</b>	<b>Cost</b>	<b>Miles</b>
2020	71.01	\$0.00	0
2021	68.51	\$0.00	0
2022	65.86	\$0.00	0
2023	63.12	\$0.00	0
2024	60.33	\$0.00	0

In the “Do Nothing” scenario, the overall network PCI is projected to decrease to 60 by 2024. In this scenario, the City’s road segments would not receive any treatment and the funding level would be zero for the entire period.

### 7.3 5-Year Current Budget Scenario (Best First)

The five-year budget scenario (best first) was set up to use the City’s recommended budget of \$75 million per year for road maintenance. This scenario is targeting the roads in better condition first (highest PCI value). In addition, 5% of the budget was allocated to preservation activities, 55% to rehabilitation activities and 40% to reconstruction activities. Figure 16 and Table 9 display the average PCI and total funded costs, respectively, in a “5-Year Budget” scenario and Table 10 lists the treatment activities with the required costs and miles.

**Figure 16: 5-Year Budget Scenario (Best First) – PCI Plot**

**Table 9: 5-Year Budget Scenario (Best First) – Total Funded Plan Cost**

<b>Year</b>	<b>Avg. PCI</b>	<b>Cost</b>	<b>Miles</b>
2021	74.57	\$9,999,423.37	22.90
2022	74.71	\$10,296,773.34	22.30
2023	73.63	\$10,606,051.96	24.14
2024	72.26	\$10,921,361.56	25.06
2025	70.75	\$11,253,513.63	23.03

**Table 10: 5-Year Budget Scenario (Best First) – Activities Breakdown**

<b>2021</b>				
<b>Activity</b>	<b>Total Cost</b>	<b>Total Miles</b>	<b>Percentage of Total Cost</b>	<b>Percentage of Total Miles</b>
Preservation	\$499,922.27	15.60	5.00%	68.12%
Rehabilitation	\$5,499,832.31	4.65	55.00%	20.29%
Reconstruction	\$3,999,668.79	2.65	40.00%	11.58%
<b>2022</b>				
Preservation	\$514,875.34	13.81	5.00%	61.91%
Rehabilitation	\$5,663,992.06	5.51	55.01%	24.71%
Reconstruction	\$4,117,905.94	2.98	39.99%	13.38%
<b>2023</b>				
Preservation	\$530,289.99	13.63	5.00%	56.47%
Rehabilitation	\$5,833,359.12	7.72	55.00%	31.97%
Reconstruction	\$4,242,402.85	2.79	40.00%	11.56%
<b>2024</b>				
Preservation	\$546,233.69	13.13	5.00%	52.42%
Rehabilitation	\$6,008,921.05	9.01	55.02%	35.96%
Reconstruction	\$4,366,206.83	2.91	39.98%	11.62%
<b>2025</b>				
Preservation	\$562,579.15	12.79	5.00%	55.56%
Rehabilitation	\$6,189,977.15	7.65	55.00%	33.24%
Reconstruction	\$4,500,957.33	2.58	40.00%	11.21%

Figure 17 displays the distribution of costs per activity and Figure 18 displays the distribution of miles per activity.

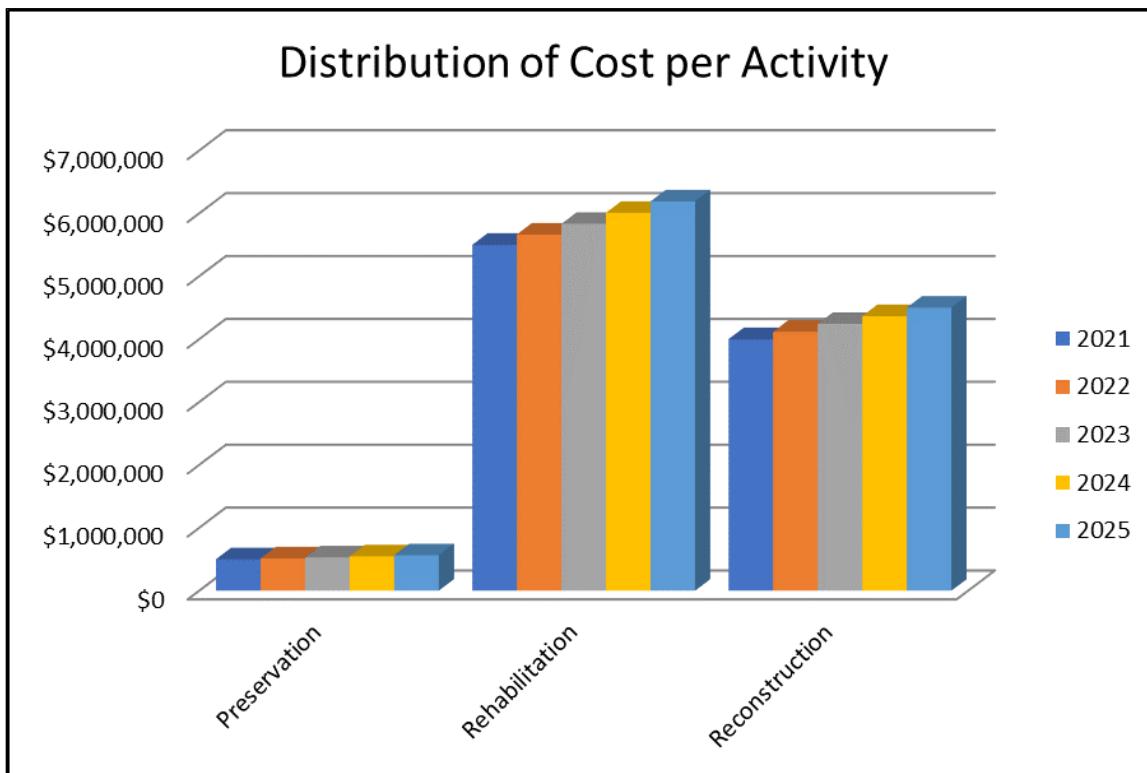

Figure 17: 5-Year Budget Scenario (Best First) – Distribution of Cost per Activity

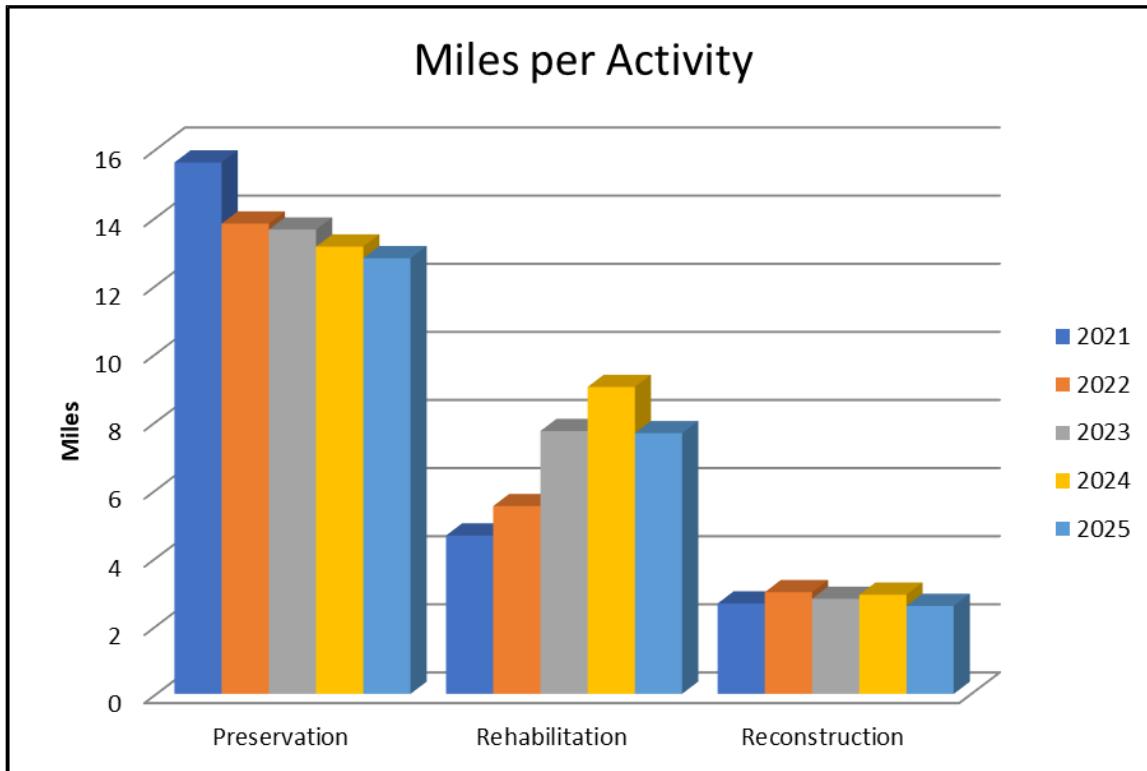

Figure 18: 5-Year Budget Scenario (Best First) – Distribution of Miles per Activity

**Synopsis:**

The overall network PCI would slightly decline from an approximate 74.57 in 2021 to 70.75 in 2025 if the City utilized their current budget of \$10,000,000.00 per year using the Best First methodology and a budget breakdown of 5% Preservation, 55% Rehabilitation, 40% Reconstruction. In this scenario, the city's street segments with the highest PCI values would be targeted first within each category of treatment; hence the best rated roads within each category would be selected, ignoring the most critical roadways for rehabilitation and reconstruction. The advantages of this scenario are that more streets can receive treatment and the good to fair condition roads will be improved and maintained in this level. The negative to this approach is that very few of the very poor and serious condition roads will be treated and more of the roads requiring rehabilitation would deteriorate into the reconstruction category.

## 7.4 5-Year Budget Scenario (Worst First)

The five-year budget scenario (worst first) was set up to use the City's recommended budget of \$75 million per year for road maintenance. In Contrast to the best first methodology, this scenario is targeting the roads in worst condition first (lowest PCI value). Like the best first methodology, 14 percent of the annual budget was allocated to preservation activities and 86 percent to rehabilitation activities. Figure 19 and Table 11 display the average PCI and total funded costs, respectively, in a "5-Year Budget" scenario and Table 12 lists the treatment activities with the required costs and miles.

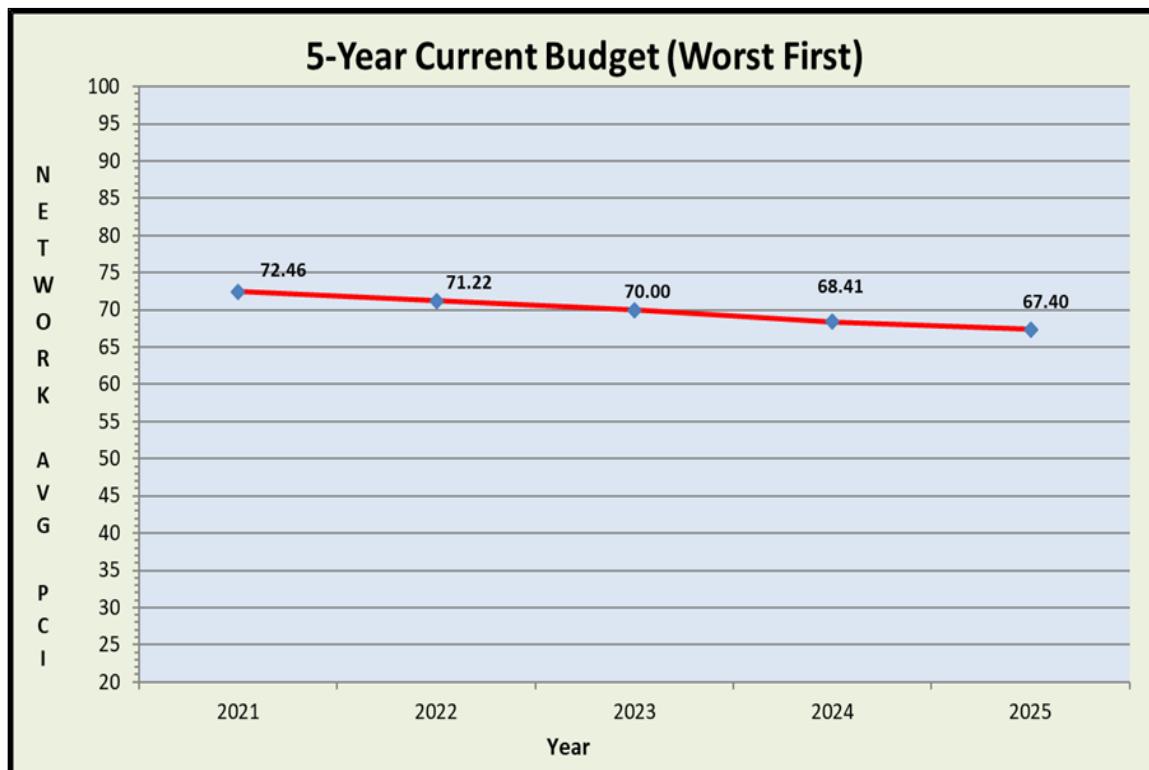

Figure 19: 5-Year Budget Scenario (Worst First) – PCI Plot

Table 11: 5-Year Budget Scenario (Worst First) – Total Funded Plan Cost

Year	Avg. PCI	Cost	Miles
2021	72.46	\$9,999,104.36	13.50
2022	71.22	\$10,298,034.58	13.00
2023	70.00	\$10,604,937.42	13.72
2024	68.41	\$10,917,748.58	13.80
2025	67.40	\$11,249,113.98	13.20

**Table 12: 5-Year Budget Scenario (Worst First) – Activities Breakdown**

2021				
Activity	Total Cost	Total Miles	Percentage of Total Cost	Percentage of Total Miles
Preservation	\$499,954.40	1.87	5.00%	13.85%
Rehabilitation	\$5,499,543.47	9.07	55.00%	67.13%
Reconstruction	\$3,999,606.50	2.57	40.00%	19.03%
2022				
Preservation	\$499,954.40	1.87	5.00%	13.85%
Rehabilitation	\$5,499,543.47	9.07	55.00%	67.13%
Reconstruction	\$3,999,606.50	2.57	40.00%	19.03%
2023				
Preservation	\$530,428.53	2.09	5.00%	15.20%
Rehabilitation	\$5,834,359.68	9.12	55.02%	66.49%
Reconstruction	\$4,240,149.21	2.51	39.98%	18.31%
2024				
Preservation	\$546,346.29	1.75	5.00%	12.67%
Rehabilitation	\$6,002,588.70	9.73	54.98%	70.54%
Reconstruction	\$4,368,813.60	2.32	40.02%	16.80%
2025				
Preservation	\$562,753.55	1.86	5.00%	14.09%
Rehabilitation	\$6,184,826.38	9.01	54.98%	68.24%
Reconstruction	\$4,501,534.06	2.33	40.02%	17.67%

Figure 20 displays the distribution of costs per activity and Figure 21 displays the distribution of miles per activity.

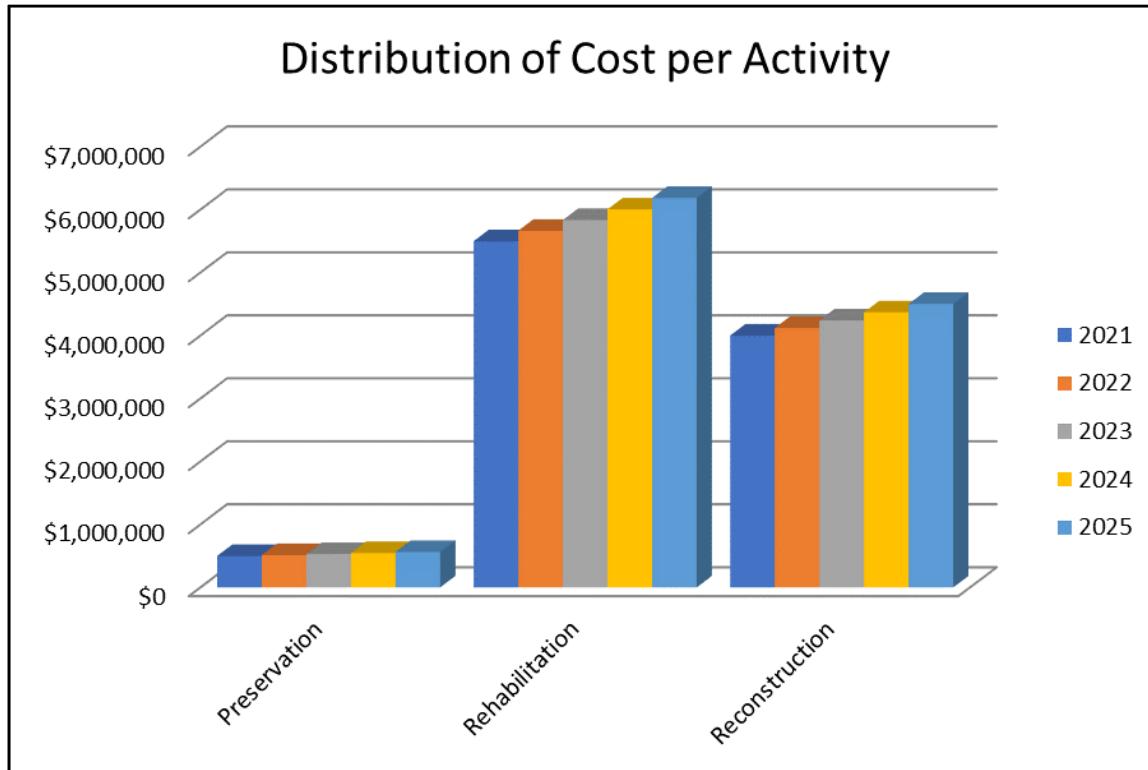

Figure 20: 5-Year Budget Scenario (Worst First) – Distribution of Cost per Activity

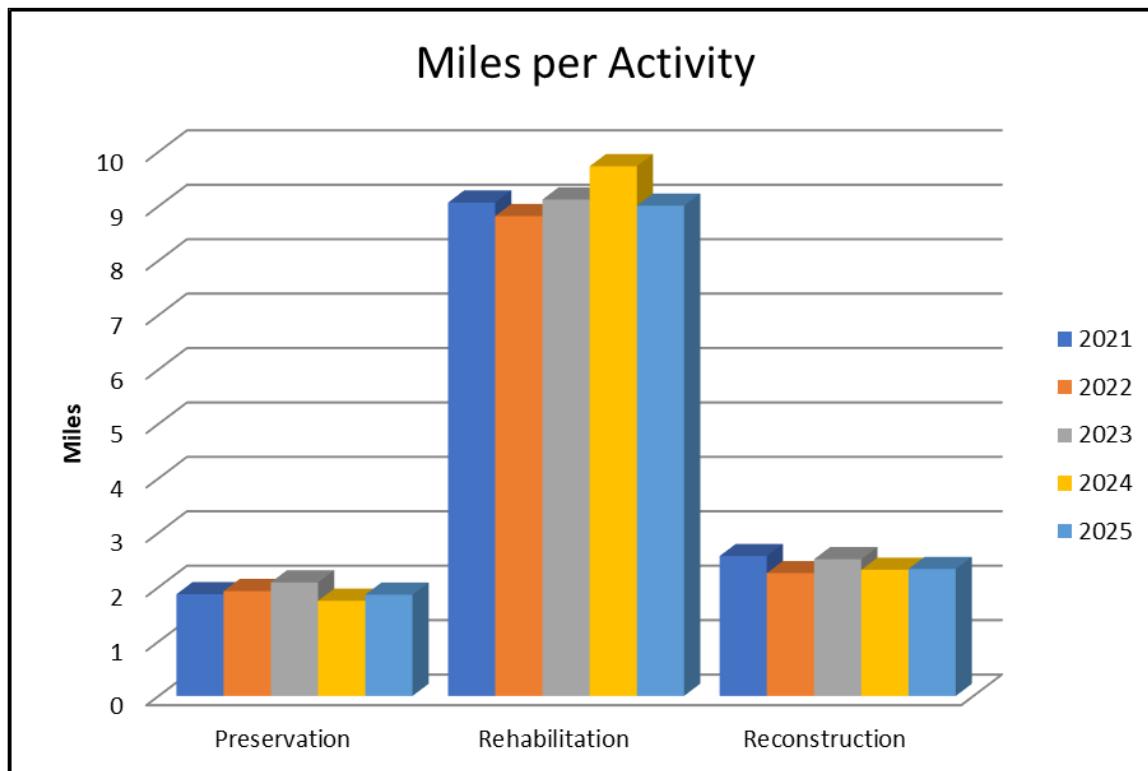

Figure 21: 5-Year Budget Scenario (Worst First) – Distribution of Miles per Activity

**Synopsis:**

The overall network PCI would slightly decline from an approximate 72.46 in 2021 to 67.40 in 2025 if the City utilized their current budget of \$10,000,000.00 per year using the Worst First methodology and a budget breakdown of 5% Preservation, 55% Rehabilitation, 40% Reconstruction. In this scenario, the city's street segments with the lowest PCI values would be targeted first within each category; hence the worst rated roads would be selected within each category. The benefit of this scenario is the worst conditions are addressed and the worst roads in the Poor category would be treated before deteriorating into the reconstruction category and the very poor to failed roads are reconstructed. However, the negative effect of this scenario is that fewer roads are selected for preventive treatment and more of the budget is expended on reconstruction treatment. Fewer miles are treated in this scenario since the most expensive sections are selected first. Using the scenario, the City will always be catching up to the roads requiring reconstruction and never slowing down the deterioration of other roads until they reach a need for reconstruction.

## 7.5 5-Year Current Budget Alternative Breakdown Scenario (Best First)

This budget scenario was setup to present an alternative to the City's current budget breakdown by targeting the roads in better condition first (highest PCI) and increasing the amount of budget allocated to preservation. For this scenario, 30% of the budget was allocated to preservation activities, 30% to rehabilitation activities and 40% to reconstruction activities. Figure 22 and Table 13 display the average PCI and total funded costs, respectively, in a "5-Year Budget" scenario and Table 14 lists the treatment activities with the required costs and miles.

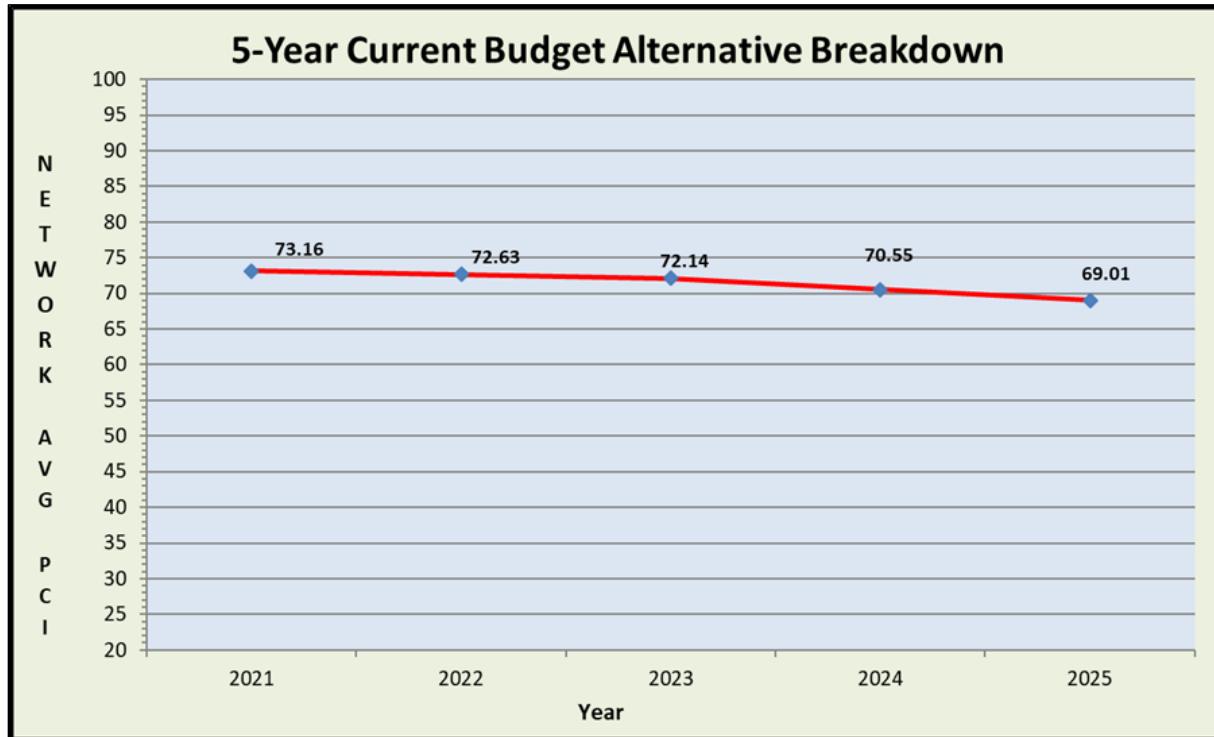

Figure 22: 5-Year Current Budget Alternative Breakdown Scenario (Best First)– PCI Plot

Table 13: 5-Year Current Budget Alternative Breakdown Scenario (Best First)– Total Funded Plan Cost

Year	Avg. PCI	Cost	Miles
2021	73.16	\$9,996,684.08	88.92
2022	72.63	\$10,296,087.03	80.92
2023	72.14	\$10,602,134.40	77.43
2024	70.55	\$10,918,055.95	78.80
2025	69.01	\$11,251,769.49	88.52

**Table 14: 5-Year Current Budget Alternative Breakdown Scenario (Best First)– Activities Breakdown**

2021				
Activity	Total Cost	Total Miles	Percentage of Total Cost	Percentage of Total Miles
Preservation	\$2,999,964.36	83.20	30.01%	93.57%
Rehabilitation	\$2,998,423.22	2.89	29.99%	3.25%
Reconstruction	\$3,998,296.50	2.82	40.00%	3.18%
2022				
Preservation	\$3,089,994.86	76.36	30.01%	94.36%
Rehabilitation	\$3,087,347.43	1.65	29.99%	2.04%
Reconstruction	\$4,118,744.74	2.91	40.00%	3.59%
2023				
Preservation	\$3,182,666.08	71.48	30.02%	92.30%
Rehabilitation	\$3,180,477.45	2.88	30.00%	3.72%
Reconstruction	\$4,238,990.88	3.08	39.98%	3.98%
2024				
Preservation	\$3,278,152.26	71.49	30.03%	90.72%
Rehabilitation	\$3,274,513.88	4.70	29.99%	5.97%
Reconstruction	\$4,365,389.80	2.61	39.98%	3.31%
2025				
Preservation	\$3,376,469.15	81.72	30.01%	92.31%
Rehabilitation	\$3,375,203.93	3.64	30.00%	4.12%
Reconstruction	\$4,500,096.41	3.16	39.99%	3.57%

Figure 23 displays the distribution of costs per activity and Figure 24 displays the distribution of miles per activity.

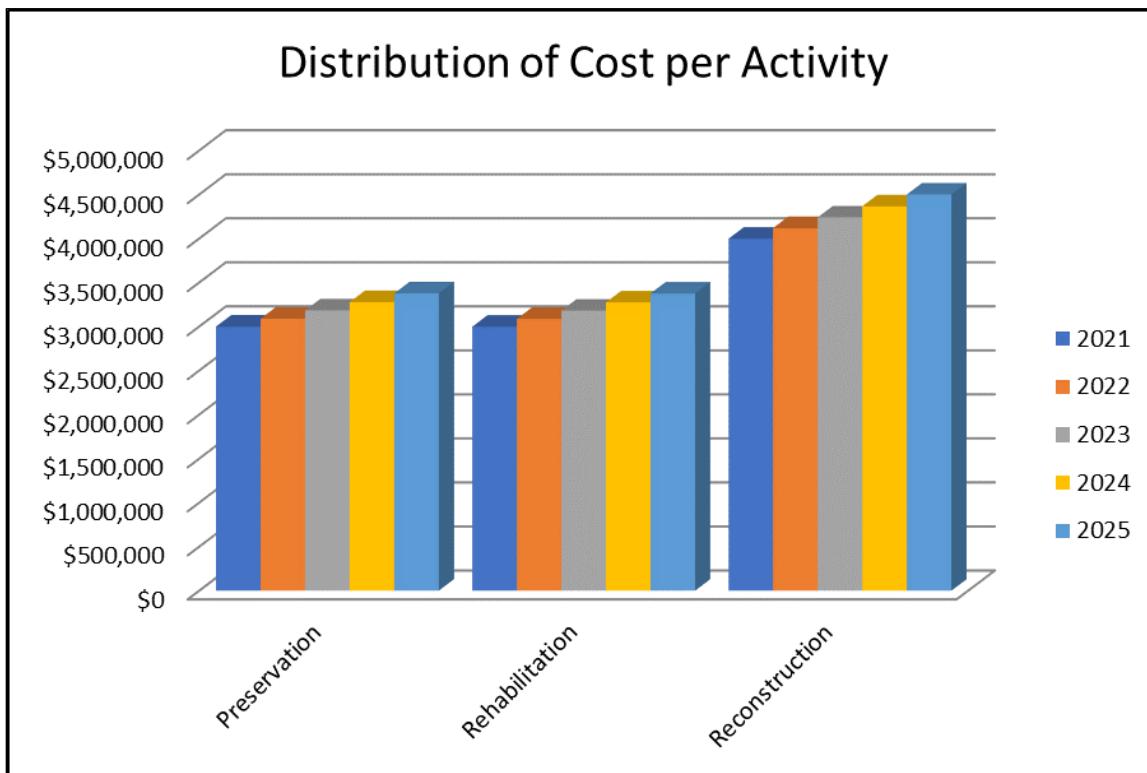

Figure 23: 5-Year Current Budget Alternative Breakdown Scenario (Best First)- Distribution of Cost per Activity

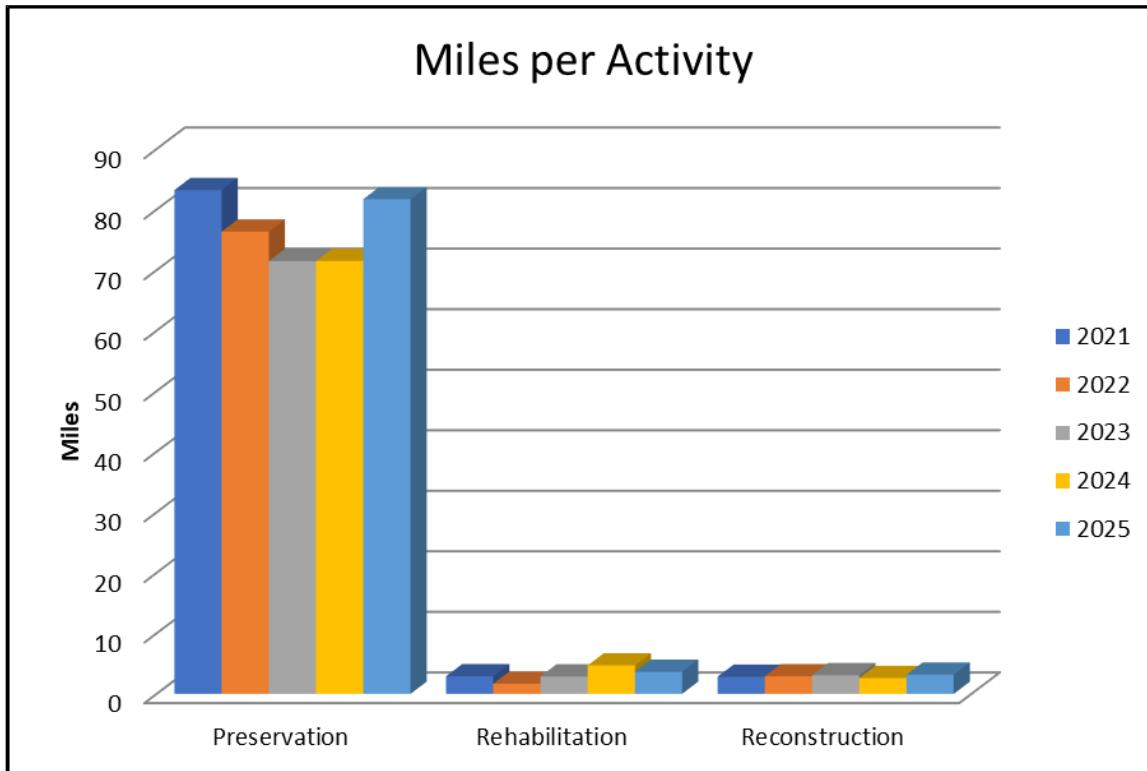

Figure 24: 5-Year Current Budget Alternative Breakdown Scenario (Best First)- Distribution of Miles per Activity

**Synopsis:**

The overall network PCI would slightly decline from an approximate 73.16 in 2021 to 69.01 in 2025 if the City utilized their current budget of \$10,000,000.00 per year using the Best First methodology and a budget breakdown of 30% Preservation, 30% Rehabilitation, 40% Reconstruction. In this scenario the cost is distributed almost equally among preservation, rehabilitation and reconstruction. However, the majority of project miles is absorbed in Preservation. While more project miles are treated in this scenario, the resulting PCI average is not improved over the Best First scenario with the existing budget distribution. This indicates more impact is recognized by treating the Poor to Very Poor roads than using more preservation techniques for this network.

## 7.6 5-Year \$15M Budget Scenario (Best First)

This budget scenario was setup to present an increase of the City's current budget by 50% (\$15,000,000.00) for five years by targeting the roads in better condition first (highest PCI). For this scenario, 5% of the budget was allocated to preservation activities, 55% to rehabilitation and 40% to reconstruction activities. Figure 25 and Table 15 display the average PCI and total funded costs, respectively, in a "5-Year Budget" scenario and Table 16 lists the treatment activities with the required costs and miles.

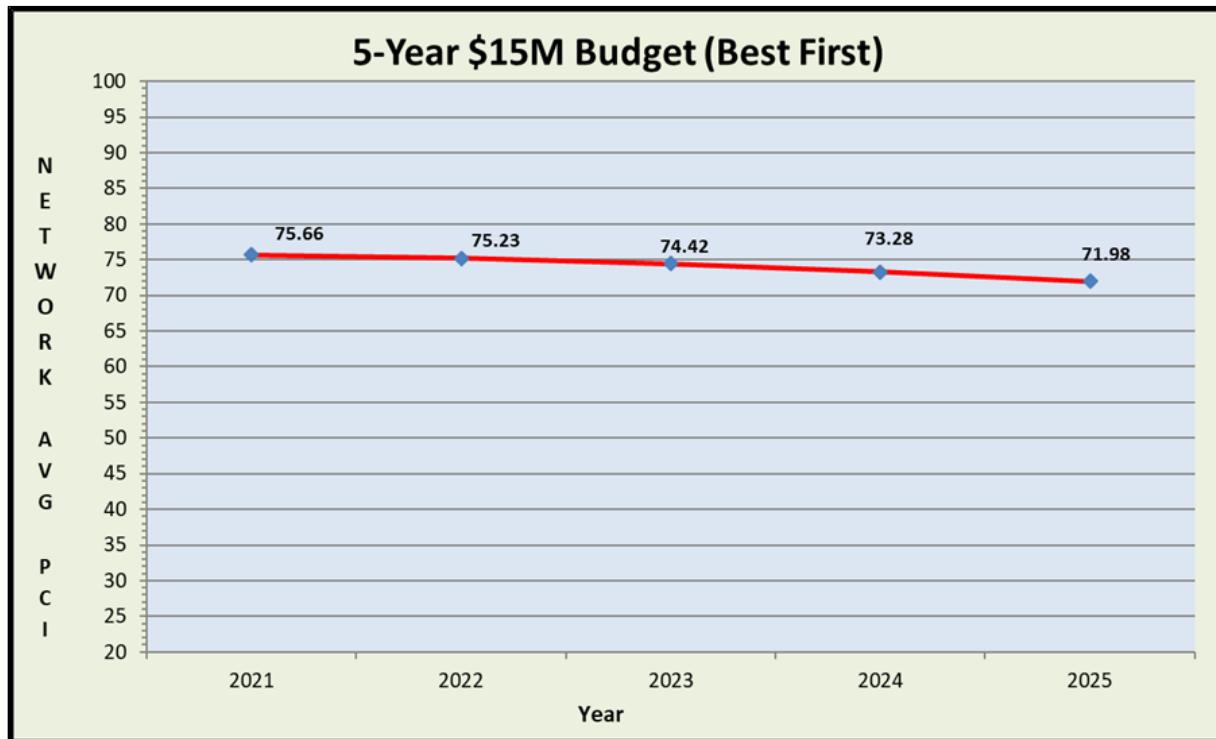

Figure 25: 5-Year \$15M Budget Scenario (Best First) – PCI Plot

Table 15: 5-Year \$15M Budget Scenario (Best First) – Total Funded Plan Cost

Year	Avg. PCI	Cost	Miles
2021	75.66	\$14,996,276.93	32.44
2022	75.23	\$14,992,097.94	36.98
2023	74.42	\$14,993,098.69	34.62
2024	73.28	\$14,992,916.77	35.19
2025	71.98	\$14,998,027.49	31.71

**Table 16: 5-Year \$15M Budget Scenario (Best First) – Activities Breakdown**

2021				
Activity	Total Cost	Total Miles	Percentage of Total Cost	Percentage of Total Miles
Preservation	\$749,976.90	21.45	5.00%	66.12%
Rehabilitation	\$8,249,974.25	6.52	55.01%	20.10%
Reconstruction	\$5,996,325.78	4.47	39.99%	13.78%
2022				
Preservation	\$749,999.43	20.48	5.00%	55.38%
Rehabilitation	\$8,249,245.79	12.15	55.02%	32.86%
Reconstruction	\$5,992,852.72	4.35	39.97%	11.76%
2023				
Preservation	\$749,975.60	18.79	5.00%	54.28%
Rehabilitation	\$8,245,203.09	11.67	54.99%	33.71%
Reconstruction	\$5,997,920.00	4.16	40.00%	12.01%
2024				
Preservation	\$749,960.21	18.99	5.00%	53.97%
Rehabilitation	\$8,248,823.39	12.39	55.02%	35.21%
Reconstruction	\$5,994,133.18	3.81	39.98%	10.82%
2025				
Local Repair	\$749,964.41	17.66	5.00%	55.69%
Surface Seal	\$8,248,841.89	10.38	55.00%	32.72%
Reconstruction	\$5,999,221.20	3.68	40.00%	11.59%

Figure 26 displays the distribution of costs per activity and Figure 27 displays the distribution of miles per activity.

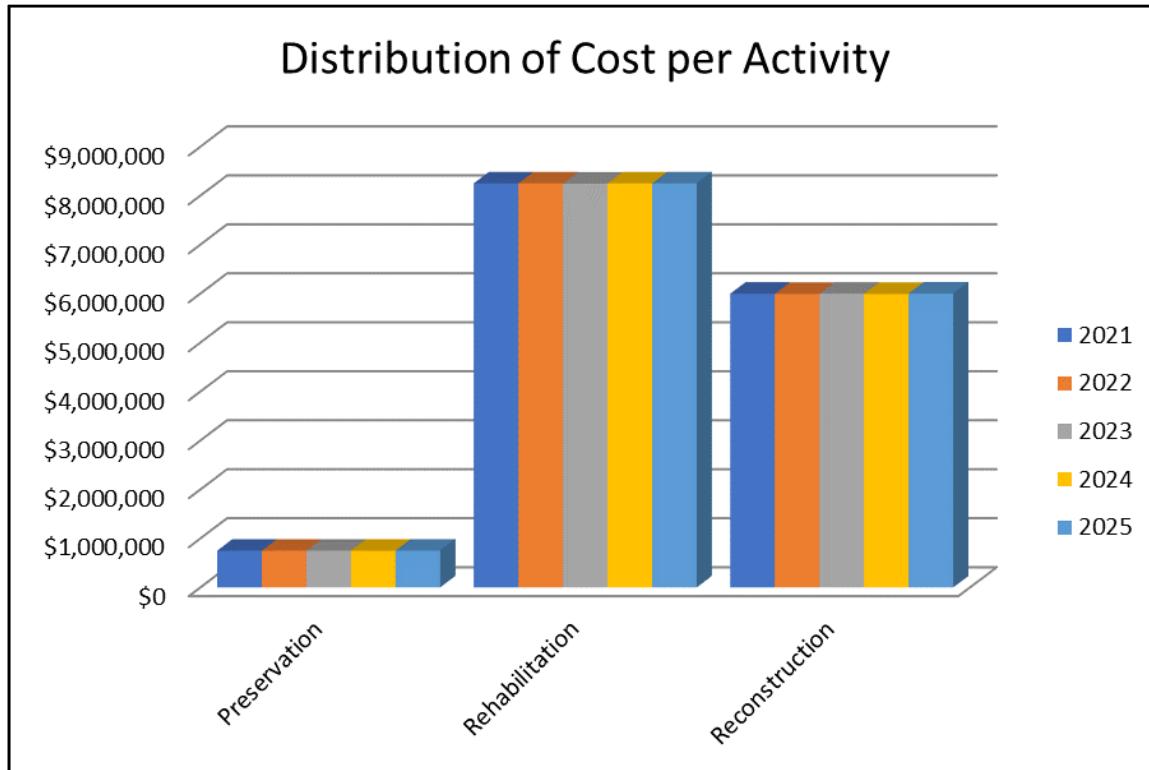

Figure 26: 5-Year \$15M Budget Scenario (Best First) – Distribution of Cost per Activity

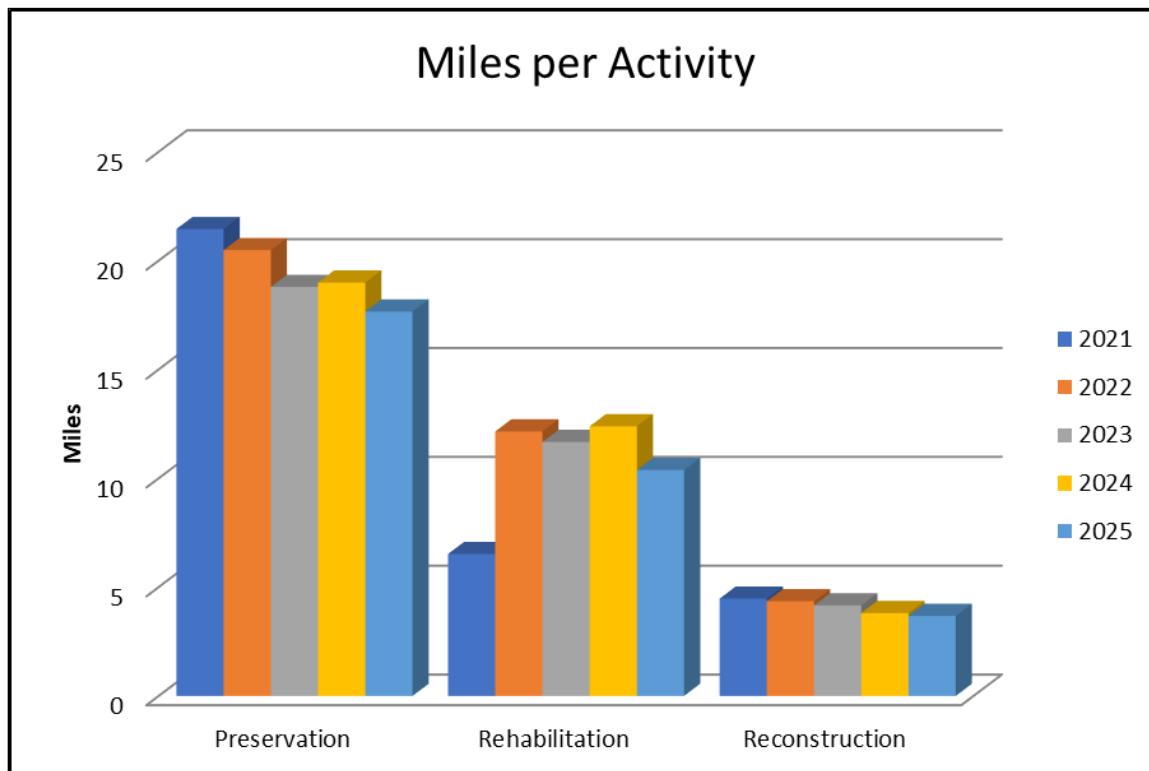

Figure 27: 5-Year \$15M Budget Scenario (Best First) – Miles per Activity per Activity

**Synopsis:**

The overall network PCI would slightly decline from an approximate 75.66 in 2021 to an approximate 71.98 in 2025 if the City utilized a budget of \$15,000,000.00 per year using the Best First methodology and a budget breakdown of 5% Preservation, 55% Rehabilitation, 40% Reconstruction. As in the 7.2 Current Budget Breakdown scenario, the city's street segments with the highest PCI values within each category would be targeted first; hence the best rated roads within each category would be selected, ignoring the most critical roadways for rehabilitation and reconstruction. The advantages of this scenario are that more streets can receive treatment and the good to fair condition roads will be improved and maintained in this level. The negative to this approach is that very few of the very poor and serious condition roads will be treated and more of the roads requiring rehabilitation would deteriorate into the reconstruction category. However, the increase in budget does not represent a significant improvement in the overall condition of the network and an increase in the number of miles treated.
